ABSTRACT

Objective: To study the role of whipworm infection in causing anaemia.

Methods: A study of 72 patients who had undergone colonoscopy for a period of 5 years from November 2009 to October 2014 was carried out inorder to find out the presence of parasitic worms during colonoscopy in these patients.

Results: Out of these 72 patients, parasitic worm was found in the colon in only one patient. The parasitic worm found in this patient was identified as whipworm or trichuris trichiura by its characteristic whip like shape. It has a short posterior thick part resembling the short handle of the whip and a long, thin anterior part resembling the distal long, thin part of the whip. In our patient with whipworm infection anaemia was not present (haemoglobin 14.4 g%).

Conclusion: Our patient was also found to have whipworm in the colon while doing colonoscopy. But anaemia was not present in our patient.

Keywords: Adult whipworm, trichuris trichiura, anaemia in whipworm infection, colonoscopy.

INTRODUCTION

Whipworms are the most common nematodes or roundworms found in the large intestine of human beings while doing colonoscopy (2). There has been also reports of finding whipworm in the large intestine of human beings while doing colonoscopy in many parts of the world (1to14). Our patient was also found to have whipworm in the colon while doing colonoscopy. A detailed study of the role of whipworm infection in causing anaemia was carried out.

MATERIALS AND METHODS

This study was conducted in the department of general surgery, Aarupadai Veedu Medical College And Hospital, Puducherry. A study of 72 patients who had undergone colonoscopy for a period of 5 years from November 2009 to October 2014 was carried out inorder to find out the presence of parasitic worms during colonoscopy in these patients. In each of these patients, presence of any parasitic worm was carefully looked for during the procedure of colonoscopy and the colonoscopic pictures of each patient were carefully studied and analysed. In patients found to have parasitic worms during colonoscopy, investigations were done to know about the presence or absence of anaemia. Anaemia is defined as haemoglobin<12g/dl or 12g% in women and haemoglobin<13g/dl or 13g% in men.

RESULTS

Out of these 72 patients, parasitic worm was found in only one patient. The parasitic worm found in this patient was identified as whipworm or trichuris trichiura by its characteristic whip like shape. This patient was an eighty year old male patient and one adult whipworm was found in the sigmoid colon of this patient while doing colonoscopy. His haemoglobin was 14.4g%. The patient was treated with a single dose of 400mg of albendazole.

Fig 1 showing clearly and entirely only the short, posterior thick part of the whitish coloured whipworm and only a very small portion of the long, thin anterior part since the anterior part penetrates into the large intestinal wall for feeding purpose.
DISCUSSION

Severe anaemia is not common in whipworm infection, hookworms present commonly in hookworm infection. Hence worms (usually less than 15) unlike large number of Trichuris trichiura and only 2-3% of that attributed to Anclylostoma duodenale. Also most people in endemic areas of Trichuris trichiura infections are colonized only by a small number of worms (usually less than 15) unlike large number of hookworms present commonly in hookworm infection. Hence severe anaemia is not common in hookworm infection, but is common in hookworm infection. Our patient also did not have any anaemia (haemoglobin 14.4 g%).

Whitish colour of whipworm
Whipworms do not feed on blood and feeds only on the tissue secretions of the large intestinal wall. Whipworm is always whitish in colour (5) as it does not feed on blood(fig1,2).

Only a very small portion of the long anterior part of whipworm seen during colonoscopy
We can see only the short posterior thick part entirely in the lumen of the large intestine (13,14) but only a very small portion of the long, thin anterior part while doing colonoscopy since most of the anterior part penetrates into the large intestinal wall in order to feed on the tissue secretions of the large intestinal wall (13,14). Hence in fig1, we can see only the short posterior thick part of the whitish coloured whipworm entirely in the lumen of the sigmoid colon but only a very small portion of the long, thin anterior part since most of the anterior part penetrates into the large intestinal wall for feeding purpose. But in the highly magnified view in fig2, we can see clearly both the short posterior thick part and also the anterior thin part clearly due to the higher magnification.

CONCLUSION
1. Whipworms are the most common nematodes or roundworms found in the large intestine of human beings while doing colonoscopy.
2. Whipworms do not suck blood and causes only minimal oozing of blood at the site of its attachment to the colonic mucosa.
3. Whipworms do not feed on blood and feeds only on the tissue secretions of the large intestinal wall.
4. Hence in whipworm (Trichuris trichiura) infection, the daily blood loss is only 0.005 ml per worm per day.
5. Hence anaemia is not common in whipworm infection.

Acknowledgement
The author sincerely thanks the staff nurse Nithya who was assisting while doing colonoscopy and the staff nurses A.K. Selvi and Nithya for their immense help rendered to the author while conducting this work. The author acknowledges the immense help received from the scholars whose articles are cited and included in references of this manuscript. The author is also grateful to authors/editors/publishers of all those articles, journals and books from where the literature for this article has been reviewed and discussed.
